

Title:	Utility Device for a Container of Liquid Matter
Applicant:	Jean-Francois Bedon
Our Reference:	21045US

Abstract

5

The invention concerns containers of liquids such as for example a beverage, and in particular but not exclusively, disposable cups, and more specifically a utensil provided in such cups. Such a device (1) can be used both for stirring, as a drinking straw, for protection from heat
10 by rigidifying the body of the cup (3), and as a support for an advertising message. Said elements (12, 30) can easily be individually detached from one another to mix or to drink a beverage, and optionally for preserving a printed information on the heat protecting sheet (2) for preventing fingers from getting burnt.
